11 · Individual Contribution Statement

TEAM011 has one member, as registered at Milestone 1. I held every project role. Because there was no teammate, there was no peer review. AI assistance was used extensively, and it is disclosed here and in the AI Collaboration Log.

Role	Lead
Product strategy lead	Joydev Pain
PM artifacts / PRD lead	Joydev Pain
UX and workflow lead	Joydev Pain
Data / evaluation lead	Joydev Pain
Prototype / build lead	Joydev Pain
Business / risk lead	Joydev Pain

Who did what on each artifact

Artifact	Responsible	AI assistance
Milestone 1 topic form	Joydev Pain	GitHub Copilot and Claude Code
First prototype	Joydev Pain	AI coding tools: GitHub Copilot and Claude Code
Prototype upgrade, test set and evaluation	Joydev Pain directed and decided	Claude Code wrote the code and ran the tests
01–07, 09, 10 and Appendix	Joydev Pain directed and reviewed	Claude Code drafted
Presentation deck and plan	Joydev Pain directed and reviewed	Claude Code drafted
08 AI Collaboration Log	Joydev Pain	Claude Code drafted from the session record
11 Individual Contribution	Joydev Pain	Claude Code drafted

Decisions I made

- The problem, target users, human-in-the-loop boundary and MVP scope (Milestone 1).
- To fix the prototype before writing, so that the documents describe a real product.
- A hypothetical US property and casualty insurer as the business setting, with onsite business analysts at US$150 an hour as the cost basis for every people role (changed from an Indian insurer in rupees).
- Commercial property as the first wedge.
- ChromaDB for the RAG layer.
- A 24-folder test set with dev and holdout groups.
- An internal value case, with no external sales, as the monetization model.
- Acceptance of the open risks in the Risk Register for a controlled pilot, subject to the launch blockers.
- A final recommendation of Pilot, not scale.

How AI was used

AI (Claude Code) drafted the documents, wrote code and ran analyses under my direction. Details, examples and corrections are in the AI Collaboration Log. Responsibility for the content and the final

recommendation is mine.

How the work was validated

With no teammate available, I used these checks in place of peer review:

1. **Holdout test:** run once after freezing the code, with no tuning afterward.
2. **Baseline comparison:** results compared with a file-name-only script.
3. **Automated tests:** 18 tests cover fail-closed behavior, citations and sign-off rules, using a scripted model.
4. **End-to-end run:** the full reviewer flow was run in Chrome, and this found further defects.
5. **Numbers recomputed:** evaluation figures come from the result files, and economic figures from a script.
6. **Personal review:** I have read every document and checked its claims.
